

eTariffLoader

Easily upload, edit, and manage previously-filed XML.

Systemtrends **eTariffLoader** is a feature in our **eTariffManager** software that uploads previously-submitted XML files, originally generated by another application or downloaded from FERC's eTariff Viewer. **eTariffLoader** allows subsequent filings to be created based on a tariff that has already been filed with FERC. The information required by FERC to submit a subsequent filing includes: Company ID, Tariff ID, Record ID, Record Parent ID, Associated Filing ID, titles, descriptions, effective dates, priority order, version, change type, and collation value. These requirements are included as part of the XML loaded into **eTariffManager** using **eTariffLoader**.

eTariffLoader features include:

- XML easily uploaded from eTariff Viewer or third party software
- Validation of XML data and schema
- Verification of duplicate filing ID and tariff ID
- Incorporated filing properties including title, ID, and filing type
- Integrated section documents including meta data and outline
- Attachments included from third party XML
- Effective, accepted, suspended, and pending filings from FERC all included in one upload

Along with our **eTariffLoader** feature, **eTariffManager** has three optional add-on applications to support your tariff management needs: **eTariffWeb** (transfers tariff documents from eTariffManager to a company content management system or public website); **eTariffCompliance** (provides a full-featured Governance Risk Compliance system for impact analysis); and **eTariffApp** (sends tariff documents directly from FERC's eTariff Viewer to an iPad). Systemtrends makes sure our software products comply with changing FERC requirements. New software offerings based on recent FERC filing requirements include: **eFile549** (converts spreadsheets to XML and PDF for the 549D filings); and, in development for an early 2012 release, **eFileEQR** (converts spreadsheets to FERC-defined XML for EQR filings).

Systemtrends **eTariffManager** is an all-inclusive tariff management software solution that generates FERC-defined XML in a stand-alone or hosted environment. **eTariffManager** converts energy tariffs to XML, and provides full-circle management for the lifespan of the tariff. Systemtrends provides service options that allow you to pay based on the number of filings or for an unlimited number of filings (for large-volume users). Regardless of the size of your company or tariff, **eTariffManager** is the ideal solution for your tariff filing requirements; we have continued to expand its features to provide our users enhanced management and filing options. How can we help you with your tariff management?

Let **eTariffManager** guide you through the tariff management process.
